

## **GNSS station list Iceland**

The service displays on the map all the Icelandic GNSS stations with GNSS products within the user-defined boundary box. By clicking on the download icon, the user can download the most relevant station metadata in a Geojson format as well as in json format.

For quality assurance, the registered metadata is compared with each GNSS data file header for each station. If there are discrepancies, the one with the wrong information is corrected. If it is not clear which information is correct, the person responsible for the data should be contacted. The date of the first GNSS data file is used as the installation date.

The metadata needed to be checked for each station are:

- Contact agency
- Installation date
- Lat lon coordinates
- Country
- 4 char marker ID
- Name
